

(a) Training: a flow-matching bridge between the geometry prior

$t = 0$ (uncorrected FDK)

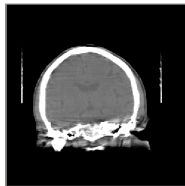

$t = 0.25$

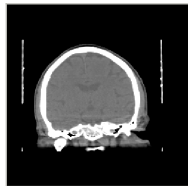

$t = 0.5$ (half the motion)

$t = 0.75$

$t = 1$ (motion-free FDK)

$x_t = \text{FDK}(A(x; P_{\text{nom}} T((1-t)\theta)), P_{\text{nom}})$ target $v_\phi(x_t, t) \approx \frac{dx_t}{dt}$, the projector's exact geometry derivative carried through the linear FDK

(b) Inference: blind predictor-corrector loop along the bridge
